

voyzSESSION 1.6.0: Recording to disk, a media pool and podcast chapters

The DAW for voice production now records straight into the project folder, gains a searchable media pool with auditioning, and delivers podcasts with chapter marks.

Siegburg, Germany, 21 September 2026 – pegelWERK releases version 1.6.0 of voyzSESSION, the DAW for voice production. It is the biggest update since launch: recording moves from memory to disk, a media pool arrives, podcasts get chapters, and the timeline can be handled the way the big DAWs do it.

From this version on, recording goes straight into the project folder, in 32-bit float and under the track's name. That removes the stalls during long sessions: until now the app held every recording fully in memory, and with ten tracks macOS began to swap. Saving links the files instead of copying them – a project with 29 GB of audio is saved in seconds instead of minutes, and takes the space only once.

The new media pool sits to the right of the timeline, where Pro Tools keeps its Clip List. It searches the open project's material, a click auditions, dragging places the file on a track. Auditioning plays at the level the file will have on the track – a bought jingle often sits 14 decibels above a broadcast-ready programme and still sounds here the way it will later. The same auditioning works inside the system's import dialog.

For podcasts there is a chapter window of its own, with time, title, image and link. Delivery is MP3 with ID3v2.3 chapter marks, cover art and episode details, plus a chapter file to the Podcasting 2.0 spec. If the cover art misses Apple Podcasts' requirements, the app says so while you pick it – otherwise you hear about it days later from the host.

Also new are session templates, fitting a take to a gap in the picture without changing its pitch, and the reference voice: the tonal character of one track is learned, and any other voice track can be matched to it. The profile belongs to the speaker and is available in every project, so one episode sounds like the last.

On formats, FLAC, Opus and the AES31-3 edit list are added. voyzSESSION now covers every common delivery format, and everything that leaves the app is ticked in one place.

In manual mode the AutoMix really is the basis now: channel strip and level ride are taken over once per track, exactly as they sounded, and appear as editable keyframes. Alongside comes software monitoring the way DAWs do it, with an "I" on each voice track.

Three bugs that could halt work are fixed: after switching audio interfaces everything could go silent, deleted recordings did not survive saving, and a recording that could not be written left silent gaps without saying so.

NEW IN 1.6.0

- Recording straight into the project folder instead of into memory, in 32-bit float and under the track's name
- Saving links the audio files instead of copying them – a 29 GB project is saved in seconds
- Media pool with search, auditioning at target level and drag-to-track, inside the system import dialog as well
- Podcast chapters with time, title, image and link; MP3 with ID3v2.3 chapter marks and a Podcasting 2.0 chapter file

- Session templates for tracks, names, colours, DSP, inserts, groups and prompter text
- Fit a take to a gap in the picture ("fit to picture"), pitch preserved
- Reference voice: learn a tonal character and match any other voice track to it
- FLAC and Opus export, plus AES31-3 edit lists
- Scroll and zoom the timeline to the selection, select a track from its head, drag a selection to another track
- In manual mode the AutoMix is the basis: channel strip and level ride as editable keyframes
- Software monitoring with an "I" on each voice track (AUTO INPUT and INPUT ONLY)
- Correct the transcript in the script editor by double-click, without touching the audio
- Fixed: dead audio device after an interface switch, deleted recordings lost on save, silent gaps on a full disk

AVAILABILITY

voyzSESSION 1.6.0 is available for download at pegelwerk.com. The update is free for existing customers. The subscription costs EUR 24.99 per month or EUR 249 per year, each including VAT and cancellable monthly. A full seven-day trial is available – no account, no email address. voyzSESSION runs on macOS.

ABOUT PEGELWERK

pegelWERK is an independent audio software company based in Siegburg, Germany, founded by Sascha Hömske. The lineup covers native apps for macOS, iPadOS and iPhone around broadcast, post production and voiceover. All apps share the same EBU R128 DSP engine. More at pegelwerk.com.
