

voyzSESSION 1.5.0: hand mixing to DAW standard, and delivery to broadcasters

The DAW for voice production gains a full manual mode, delivery profiles for five markets, and MP2 export. Transcription still runs offline on your own machine.

Siegburg, Germany, 9 September 2026 – pegelWERK releases version 1.5.0 of voyzSESSION, the DAW for voice production. Until now the automatic path was the point: load a video or a script, speak, click Auto Mix, done. That way of working is unchanged – alongside it there is now a manual mode that lets you mix by hand like a classic DAW.

The manual mode brings channel strips, groups and automation in the four familiar modes Read, Touch, Latch and Write. A mix produced automatically in assist mode can be carried over as the starting point and edited from there. Switching between the two modes is the normal case, not the exception: recording usually happens with the automatic path, editing and mixing by hand.

For delivery to broadcasters there are ready-made delivery profiles: EBU R128, US ATSC, ARD/ZDF HDF01a, ARIB RDD9 and CST AS-10. The MXF carries eight sound tracks with a configurable layout, and the source M&E is preserved. New as well is MP2 export – raw and inside a WAV container, the way many playout systems expect it – plus AAC and MP3. If the delivery profile's loudness target does not match the chosen format profile, the export window says so before rendering.

Transcription still works offline and word-accurate. The speech model ships with the app, all lanes appear in one text and coloured per lane, and clicking a word moves the playhead. Subtitles come out as SubRip or WebVTT.

As before, everything runs locally on your own machine: no cloud sync, no upload, no streaming. voyzSESSION is written natively in C++ on JUCE 8.

NEW IN 1.5.0

- Manual mode with channel strips, groups and automation in Read, Touch, Latch and Write
- Central export window: format and quality per output – mix, voice stem, one file per speaker lane, video or MXF
- MP2 export, raw and inside a WAV container, plus AAC and MP3
- Delivery profiles for EBU R128, US ATSC, ARD/ZDF HDF01a, ARIB RDD9 and CST AS-10, with a configurable track layout
- More format profiles: ATSC A/85, ARIB TR-B32, OP-59 and CST-RT-040, each with its own loudness target and true peak

- Your own plugins as inserts: five slots per channel, plus voice, IT/FX and master groups (AU and VST3)
- Neural noise removal based on DeepFilterNet 3, and V-PUNCH, the voice-driven way into a recording
- Virtual camera and virtual audio device: the session appears in any application that takes a camera – with burnt-in timecode and a pre-roll counter, without extra software
- Hardware desks over Mackie Control, with motor faders and feedback
- Recordings are streamed from disk instead of being held entirely in memory

AVAILABILITY

voyzSESSION 1.5.0 is available for download at pegelwerk.com. The update is free for existing customers. The subscription costs EUR 24.99 per month or EUR 249 per year, each including VAT and cancellable monthly. A full seven-day trial is available – no account, no email address. voyzSESSION runs on macOS.

ABOUT PEGELWERK

pegelWERK is an independent audio software company based in Siegburg, Germany, founded by Sascha Hömske. The lineup covers native apps for macOS, iPadOS and iPhone around broadcast, post production and voiceover. All apps share the same EBU R128 DSP engine. More at pegelwerk.com.
